Whales are filter feeders, which means they eat by filtering small organisms out of the water. This makes them particularly vulnerable to water pollution, as they can easily ingest plastic waste and other harmful substances.

Plastic waste can block whales' digestive tracts, causing them to starve to death. It can also entangle whales, making it difficult for them to swim or breathe. In some cases, plastic waste can even cause whales to drown.

The problem of water pollution is not just a problem for whales. It's a problem for all marine life. Plastic waste can harm fish, sea turtles, and other animals. It can also damage coral reefs and other important marine habitats.

There are a number of things that we can do to help reduce water pollution and protect marine life. One of the most important things we can do is to reduce our use of plastic products. We can also recycle plastic products and dispose of them properly.

We can also support organizations that are working to clean up our oceans and protect marine life. These organizations are doing important work to reduce water pollution and protect the animals that live in our oceans.

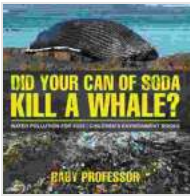

Here are some specific things that you can do to help reduce water pollution:

- Reduce your use of plastic products.
- Recycle plastic products.
- Dispose of plastic products properly.
- Support organizations that are working to clean up our oceans and protect marine life.

By taking these simple steps, we can all help to reduce water pollution and protect marine life.

**Here are some additional resources that you may find helpful:**

- National Geographic: Plastic Pollution Facts
- Ocean Conservancy
- Greenpeace
