The Sun: A Star

The sun is a star. It is a giant ball of hot gas that gives off light and heat. The sun is the center of our solar system. It is the largest object in our solar system, and it makes up about 99% of the mass of our solar system.

The sun is about 93 million miles away from Earth. It takes light about 8 minutes to travel from the sun to Earth.

The Sun's Energy

The sun's energy comes from nuclear fusion. This is a process that combines two atoms into one, releasing a great amount of energy.

The sun's energy is essential for life on Earth. It provides the light and heat that plants need to grow. It also evaporates water, which creates clouds and rain.

The Sun's Atmosphere

The sun has a thick atmosphere. The atmosphere is made up of several layers, including the photosphere, the chromosphere, and the corona.

The photosphere is the visible surface of the sun. It is about 10,000 miles thick.

The chromosphere is a thin layer of gas that surrounds the photosphere. It is about 10,000 miles thick.

The corona is the outermost layer of the sun's atmosphere. It is made up of very hot gas. The corona can be seen during a solar eclipse.

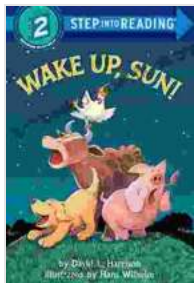

The Sun's Impact on Earth

The sun has a significant impact on Earth. The sun's gravity keeps Earth in orbit around the sun.

The sun's light and heat create Earth's climate. The sun's energy also drives the water cycle. The water cycle is the process by which water evaporates from Earth's surface, condenses into clouds, and falls back to Earth as rain or snow.

The sun is a fascinating object. It is a star that provides us with light, heat, and life. The sun is an important part of our solar system, and it has a significant impact on Earth.

This Step into Reading book is a great way for young readers to learn about the sun. The book is full of simple text and bright illustrations. It is perfect for young readers who are learning to read.
